In the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended): A method for transferring information between first and second systems with dissimilar first and second database structures, respectively, comprising the steps of:

extracting data from the first system, wherein the data is comprised of a plurality of records, with each record including at least one index;

5 routing the extracted data from the first system to a first conversion server;

at the first conversion server, converting the data from a format compatible with the first database structure to an intermediate format, the first conversion server operable to convert an index compatible with the first database structure to an intermediate index that is relationally associated with the index in the first database structure;

10 routing the data in the intermediate format to a second conversion server;

at the second conversion server, converting the data from the intermediate format to a format compatible with the second database structure by converting the intermediate index to an index compatible with the second database structure; and

storing the data converted at the second conversion server in the second system.

2. (Original): The method of Claim 1, wherein the step of extracting is initiated in response to an external request.

3. (Original): The method of Claim 1, wherein the step of extracting is performed in response to a trigger operation at the first system which initiates the step of extracting and routing to the first conversion server.

4. (Original): The method of Claim 1, wherein the first and second conversion servers are disposed on a network and communicate with the first and second systems and with each other through the network and/or in the step of routing data comprises routing data over the network.

AMENDMENT AND RESPONSE

S/N 09/887,494

Atty. Dkt. No. ATTA-25,514

5. (Cancelled):

6. (Currently Amended): The method of Claim [[5]], wherein the intermediate index has a finite length, such that all data transactions in between the first and second conversion servers are operable to transmit finite length index values.

7. (Currently Amended): The method of Claim [[6]], and further comprising an intermediate processing step wherein at least a portion of the converted data that is transmitted from the first conversion server to the second conversion server is processed in the intermediate format.
